by OpenAI Codex

Multiple MongoDB insert/update

```rust
for document in &documents {
    let filter = Self::contact_identity_filter(&document);
    let serialized = bson::to_document(&document)?;
    let result = collection
        .update_one(filter, doc! {"$setOnInsert": serialized})
        .upsert(true)
        .session(&mut *session)
        .await
        .map_err(Self::contact_write_error)?;
    if result.upserted_id.is_some() {
        inserted_documents.push(document.clone());
    }
}
```

Single MongoDB insert/update using bulk_write

```rust
let models = documents
    .iter()
    .map(|document| self.recipient_contact_upsert_model_from_document(document))
    .collect::<eyre::Result<Vec<_>>>()?;
let result = self
    .db_client
    .bulk_write(models)
    .verbose_results()
    .session(&mut *session)
    .await
    .map_err(Self::contact_write_error)?;
let inserted_documents = documents
    .iter()
    .enumerate()
    .filter(|(index, _)| {
        result
            .update_results
            .get(index)
            .is_some_and(|result| result.upserted_id.is_some())
    })
    .map(|(_, document)| document.clone())
    .collect::<Vec<_>>();
```
